```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         õ
    The present sequence represents a multiple sclerosis (MS) associated retrovirus (MSRV) genomic fragment used in the method of the invention. The invention provides complete or partial genomic sequences of the MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these genes. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also claimed useful for diagnosing infection by MS and rheumatoid arthritis-associated viruses, and also for prevention and treatment of infection with these viruses

                                                           the pol gene of a treating multiple
                                                                                                                          The invention relates to an isolated nucleic acid which comprises the gene of a retrovirus associated with multiple sclerosis or rheumatoid arthitis. The methods and compositions of the present invention are useful for diagnosing, preventing and/or treating multiple sclerosis and/or rheumatoid arthitis. The present sequence is used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360
                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents the nucleotide sequence corresponding to the 3' env region and long terminal repeat sequences from clone CL6 of MNILiple Sclerosis retrovirus (MSRV-1). The specification describes a long terminal repeat (LTR)-RUS region which encodes the expression of a MSRV-1 protein. This is unusual for LTRs, in particular in the RUS region. The sequence includes CAAT and TARA signals which are present in the features table. Probes and artibodies to the MSRV-1 retrovirus to the in and encoding polynucleotide sequences are used to detect the presence of MSRV-1 retrovirus in a biological sample. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes an envelope protein of MSRV-1. The envelope protein expressed by the endogenous human retrovirus MRSV-1 has superantigen activity associated with autoimmune disease. The protien can be detected using the method of the invention. The specification describes a process for detecting activity of a superantigen in a biological sample. The process comprises identifying large scale sexpansion or loss of lymphocytes that carry at least one of the Vbetal6 and/or Vbetal7 determinants. The method is used to screen for agents that inhibit the superantigen, especially those associated with MRSV-1 which is implicated in autoimmune disease, particularly multiple sclerosis. These agents are potentially useful for treatment or prevention (e.g. as vaccines) of autoimmune diseases

primer for the amplification by polymerisation of a nucleic acid of a viral material associated with multiple sclerosis or rheumatoid archivitis, a polypeptide exhibiting an inhibitory activity on the proteolytic, reverse transcriptes or ribonuclease H activity from MSRV, and an antibody directed against the MSRV-1 virus obtained by immunologically reacting a human or animal body or cells with an immunogenic agent consisting of the antiganic polypeptide defined above. The nucleic acids are useful for detecting a biological sample a virus associated with multiple sclerosis or rheumatoid arthritis, or for associated with multiple sclerosis or rheumatoid arthritis. Or for associated with multiple sclerosis or rheumatoid arthritis. The present sequence is a claimed MSRV-associated sequence whose identity cannot be accurately determined. Note: The SEQ ID numbers for the sequences as displayed in the main body of the patent do not match the SEQ ID numbers in the sequence listing. Consequently those sequences mentioned in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATACTCGCCTGGTGAGCCTATTTAATACCACCTCACTCGGCTCCATGAGGTCTCAGCC 540

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated or purified nucleic acid associated with multiple sclerosis and/or rheumatoid arthritis, useful for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated or purified nucleic acid from a virus associated with multiple sclerosis and/or rheumatoid arthritis, multiple sclerosis-associated virus (MSRV)-1. The nucleic acids comprise pol, gas or reverse transcriptase genes (or their fragments) encoding the proteins or defined peptides (including immunodominant peptides, antigenic peptides or conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample, a nucleic acid probe for the detection of a virus associated with multiple sclerosis or rheumatoid arthritis, a

and mucleic acid molecules encoding such proteins. EMBRY sequences are useful for screening modulators useful for treating or preventing disorders associated with abnormal expression of EMBRY. The disorders treated include reproductive disorders such as infertility, endometriosis, endometrial or ovarian tumour; autoimmune/inflammatory endometriosis, endometrial or ovarian tumour; autoimmune/inflammatory contact dermatitis; disorders of the placenta such as preeclampsia, abruptic placentes etc. Sequences of the invention are also useful for analysing a proteome of a tissue or a cell type. EMBRY proteins are useful as immunogens for preparing antibodies. Polynucleotides of the invention are useful for creating knockin humanised animals or transgenic animals to model human diseases. They are also used in gene therapy. The

The invention relates to identifying compounds which are modulators of syncytin expression. The syncytin modulators are useful in diagnosis and treatment of preeclampsia and gestational trophoblast disorders (e.g. choriocarcinoma, hydatiform mole, placental site tumour and missed, incomplete abortion). Syncytin is a human gene derived from the envelope gene of human endogenous defective retrovitus, HRRV-W. The present invention is based partly on the discovery that syncytin expression is dramatically reduced in preeclampsia, and is also mis-localised to the apical syncytiotrophoblast membrane. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a compound for treating a subject with or at risk of developing preeclampsia, comprises determining whether the expression or activity of syncytin in the cell is modulated in the presence of a test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACGCGGCTTCCTGGAAATATTGATGCCCCATCATATAGGAGTTTATCTAAGGGAAACTCC

This invention describes novel human secreted proteins encoded by polynucleotides isolated from human adult testes, adult brain, adult blood or adult placenta, or murine adult bone marrow or thymus cDNA libraries. The products of the invention are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, haemacopoiesis regulating activity, tissue growth activity, and activity, chemoatopoiesis regulating activity, tissue growth activity, and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                 Secreted protein; testes; brain; blood; placenta; human; murine; thymus; bone marrow; treatment; prevention; nutrition; cytokine; immune; vaccine; cell proliferation; cell differentiation; suppressor; tumour inhibition; haematopoiesis regulator; activin; inhibit; chemotactic; chemokinetic; haemostatic; thrombolytic; receptor; ligand; anti-inflammatory; tumour; cadherin; tumour invasion suppressor; gene therapy; tissue growth; ss.

                                                                                      This is the human secreted protein AJ172 2 nucleotide sequence, obtained from a human adult testes CDNA library. The invention relates to secreted human and murine proteins. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Detection of the levels of the proteins can be used for the diagnosis of e.g. pre-eclampsia, placental pathology or cancer. Agents which modulate the expression or function of the proteins may be used for treating a neoplastic disease and inhibiting metastasis. Other suggested activities include nutritional activity (e.g. in feeds), cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, itsue growth activity, activity, haematopoiesis regulating activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

Croscominar proteins. The polynucleotides are useful for

Croscombinant proteins for analysis and are also useful so

chromosome markers or tags to identify chromosomes or to map related gene

chromosome markers or tags to identify chromosomes or to map related gene

chromosome markers or tags to identify chromosomes or to map related gene

continued. The proteins are useful as amino acid supplement, carbon

continued immunodeficiency (SCID)), autoimmune disorders (e.g. severe

combined immunodeficiency (SCID)), autoimmune disorders (e.g. multiple

continued immunodeficiency (SCID)), autoimmune disorders (e.g. multiple

continued immunodeficiency (SCID)), autoimmune disorders (e.g. multiple

coleropsis, systemic lupus erythematosus, rheumacoid arthritis), allergic

calerosis, systemic lupus erythematosus, rheumacoid siseases (e.g.

cosqulation disorders, inflammatory diseases (e.g. systemic inflammatory

cosqulation disorders, inflammatory diseases (e.g. systemic inflammatory

cresponse syndrome (SIRS), ischaemia-reperfusion injury, Crohn's disease),

conspubliaxis and hypersensitivity, Proteins are also useful for inducing

cumour immunity, for inducing bone, cartilage, tendon, ligament and/or

cregomerating nerve and brain tissue, for inducing fertility and for

cregomerating nerve and brain tissue, for inducing fertility and for

chibibiting tumour growth. Proteins are also useful as chemokine for

mammalian cells (e.g., monocytes, fibroblasts, neutrophils), and also

cuseful as inhibitors of receptor/ligand interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proteins AZ3021 encoded by clone AZ3021 from human adult colon, and BD12716 encoded by clone BD12716 from human fetal kidney cDNA library, useful for treating e.g. multiple sclerosis and rheumatoid arthritis.

cc endogenous retrovirus (HERVs) the full length endogenous provirus which was been located on the long arm of human chromosome 7 (7q21-22) has been designated HERV-W. The present invention describes proteins or peptides (1) having superantigen (SAQ) activity comprising the ENV protein (ENV) of HERV-W, the surface protein (SU) and transmembrane (TM) sub-units. (I) have neuroprotective activity, and can be used in: vaccines; antisensetherapy; and HERV-W SAQ activity-inhibitors. (I) and encoding DNA/RNA are useful for diagnoshing multiple sclerosis (MS) or HERV-W-associated disorders. (I) are also useful for identifying substances (and optionally crecovering) capable of binding to a retroviral superantigen associated with MS, substances capable of binding to a retroviral substances capable of binding to a retroviral substances capable of binding to a retroviral substances capable of binding to a retroviral substances capable of binding to a retroviral substance capable of blocking space of capable of blocking standing an immune response devoid of SAQ activity and being capable of generating an immune response capable of blocking sAQ activity, capable of binding to a retroviral capable of blocking transcription or translation of HERV-W retroviral superantigen for use in treating or translation of HERV-W retroviral superantigen for use in treating or prevention of MS. (I) and nucleic acids encoding them are useful for diagnosing autoimmune disease. The present sequence encodes the specifically claimed envelope protein of HERV-W designated G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 GCACCCCCCCCCTCCATGCCGCTCTATGACCCGCTTACCCAGAGAGTTTCTATGGAGA 120

The present invention relates to new mucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Regulatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunor response, e.g. in immunofensay. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, neuropathologies or other autoimmune diseases. The present sequence was
                                                                                                                                                                               New nucleic acid sequences of human endogenous retrovirus, HERV-7q, use for diagnosis, treatment and prevention of autoimmune and neurological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1168
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Requilatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immuno response, e.g. in immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

acquired or inherited genetic diseases. Example 1; SEQ ID NO 21; 30pp; English.

The invention relates to a nucleic acid hybridisation probe comprising a labelled, single copy nucleic acids of at least 50 nucleotides, which will hybridise to a deduced single copy sequence interval in target uncleic acid (TNA) of known sequence. The single copy sequence is deduced by comparing the target sequence. The single copy sequence is deduced by comparing the target sequence. The probe is essentially free collection of high and low complexity repeat sequences as found in the collection of high and low complexity repeat sequences as found in the collection of high and low containing the target nucleic acid. The probe is genome of the organism from containing the target nucleic acid. The probe is generated by PCR on the target sequence. The probe is essentially free cof blocking nucleic acid sequences which will hybridise to repeat cof blocking nucleic acid sequences which will hybridise to repeat collecting a useful in a hybridisation method, where the hybridisation method is from in situ hybridisation method, where the hybridisation method is from in situ hybridisation, Southern blot, and cother methods in which nucleic acid which will confident and aduption or triplicon sequence domain. The probe is useful hybridises to the genome at more than three preferably ten different corputions as a determination of new repeat sequence from a cottermining achromeome breakpoint and is useful in the fields for determining a chromeosome breakpoint and is useful in the fields for cytogenetics may be used to enalyse specific chromosomal locations by in sight whore probes may be used to analyse specific chromosomal locations by in situ hybridisation as a detection of acquired or inherited genetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                       480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  900
diseases especially for detection of genetic or neoplastic disorders. Unlike prior art techniques, the probe permits more precise chromosomal breakpoint determinations by in situ hybridisation. The genomic sequence comprising the human HIRA gene (histone cell cycle regulation defective, S. cerevisiae, homologue A) was analysed for single copy sequence therevals for use as probes of the invention. HIRA is located on chromosome 22 as a duplicate, deletions of 1 copy lead to bideorge and velo-Cardio-facial syndromes. The present sequence is a high complexity repeat found within the human genome used to analyse the HIRA gene for repeat regions. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8058
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8118
                                                                                                            The present invention relates to new nucleic acid sequences of human endogenouse retrovirus, HERV-7q, which is located on chromosome 7q. Regulatory elements associated with HERV-7q may alter expression of other genes (even remote genes) on the same chromosome, inducing immunological and/or neurological changes (which may be pathological or protective/curative). HERV-7q peptides can be used to improve efficiency of the immunotesaponse, e.g. in immunotherapy. HERV-7q peptides and their coding sequences can be used in immunogenic or vaccinating compositions, for protection against autoimmune diseases, particularly multiple sclerosis. The peptides may also be used (by sequence comparison) to detect/identify endogenous retroviruses that are abnormally expressed in cancer, neuropathologies or other autoimmune diseases. The present sequence was used to illustrate the invention

The present invention describes a method (MI) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Horrigan
